Trial of Improvisational Music Therapy’s Effectiveness for Autism (TIME-A): What have we learned from 278 children in 9 countries?

Christian Gold, Ph.D (Norway)
Music therapy is a promising treatment for children with autism spectrum disorder, based on several small studies. This project aims to provide definite evidence of its long-term effects and dose-effect relation. We followed 278 children from 9 countries over one year, assessing autism symptoms, social responsiveness and quality of life.

Christian Gold, PhD, principal researcher, Uni Research Health, Bergen, Norway; editor, Nordic Journal of Music Therapy; professor, University of Bergen and Aalborg University; music therapist.
